SEASONAL ADJUSTMENT

Seasonal adjustment is a means of removing the estimated effects of normal seasonal variations from economic time series so that the effects of other influences are obvious. Seasonal variations are the systematic (though not necessarily regular) intra-year movements of economic time series. These are often the result of non-economic phenomena, such as climatic changes and regular religious festivals, e.g. Christmas and Easter.

TREND ESTIMATE

Smoothing seasonally adjusted series produces a measure of trend by removing the impact of the irregular component of the series. The trend estimates are derived by applying a 13-term Henderson weighted moving average to the respective seasonally adjusted series. Readers are reminded that trend estimates are subject to revision as subsequent months' data become available.

CHANGES IN THIS ISSUE

New seasonal factors calculated in the annual seasonal re-analysis have been introduced in the publication Housing Finance for Owner Occupation, Australia (Cat. no. 5609.0) (monthly). These have resulted in revisions to all seasonally adjusted and trend estimates published as Secured Housing Finance Commitments, Dwelling Units in table 17.
